Education

Honours Bachelor of Science in Computer Science, York University, Toronto Exp. Oct 2027

Relevant Courses: Data Structures, Databases, Algorithms, Software Design

Technical Skills

Languages: Java, Python, TypeScript, JavaScript, SQL, HTML, CSS, Bash

Frameworks & Libraries: Spring Boot, Next.js, React, Node.js, Tailwind, Hibernate ORM, Prisma, BetterAuth

Testing: JUnit, Mockito, MockMvc

Databases: PostgreSQL, SQL Server

Tools & Cloud: Git, Docker, AWS Lightsail, Vercel, Android Studio

Projects

Hierarchical Document Workspace App (**Demo** | **Code** | **Live Site**)

- Built and deployed a full-stack document workspace via **Next.js**, React, TypeScript, Tailwind, PostgreSQL, and Prisma on Vercel, featuring nested pages with breadcrumb navigation
- Separated the app into Server Actions, service layer for business logic and ownership checks, and Prisma for data access
- Implemented session-based **authentication** (BetterAuth) and ownership-based authorization across page operations, so users can only access their own documents
- Built PostgreSQL **full-text search** with GIN indexes and stored search vectors to avoid recomputing them on each query
- Added **debounced, paginated search** to cut queries by **~80%** for a typical 10-character phrase and to keep result payloads small
- Extended the BlockNote editor via custom blocks and menus, with debounced autosave to cut redundant database writes

Bank Mobile App (**Demo** | **Code**)

- Built and deployed a RESTful Java banking system with **Spring Boot**, PostgreSQL, and Hibernate ORM, designing the schema and organizing code into controller, service, and repository layers
- Built client UI in Android Studio integrated with REST endpoints for account creation, deposits, withdrawals, transfers, and statements
- Applied TDD with JUnit, Mockito, and MockMvc, covering success and failure paths for banking operations with service-layer **unit tests** and controller-to-H2 **integration tests**
- Centralized business-rule validation in the service layer, rejecting invalid operations before they reach the repository layer
- **Dockerized** the API & deployed to AWS Lightsail, so the Android app could reach it remotely

Driving Simulation (**Demo** | **Code**)

- Built a **Python** driving game where one navigates traffic to a finish line, tracked by a live progress bar
- Utilized PyGame API to develop application logic & UI elements (e.g. vehicles, live progress bar)
- Designed dynamic generation of AI traffic & rule-based movement logic, creating varied collision scenarios
- Implemented end-of-game states using bounding-box collision detection, screen-boundary checks, and finish-line detection

Experience

Orientation Logistics Volunteer — University of Toronto Aug 2019

- Assembled **8,000+ orientation kits** with student supplies, coordinating with a team of 100+ volunteers
- Cleared and sorted 5,000+ packing by-products to keep the workspace organized

Merchandiser Volunteer — Salvation Army Thrift Store Aug 2019

- Inspected and tagged **100+ books** for removal based on condition criteria, keeping customer-facing shelves stocked with sellable inventory
- Reshelved **100+ misplaced items** and realigned **200+ products** to keep the store organized and easy for customers to browse
