jordantran092@gmail.com GitHub | Website Portfolio | LinkedIn 647-323-2782

Education

Honours Bachelor of Science in Computer Science, York University, Toronto Exp. Oct 2027
Relevant Courses: Data Structures, Databases, Algorithms, Software Design (in progress)

Technical Skills

Languages: Java, Python, TypeScript, JavaScript, SQL, HTML, CSS, Bash

Frameworks & Libraries: Spring Boot, Next.js, React, Node.js, Tailwind, Hibernate ORM, Prisma, BetterAuth

Testing: JUnit, Mockito, MockMvc

Databases: PostgreSQL, SQL Server

Tools & Cloud: Git, Docker, AWS Lightsail, Vercel, Android Studio

Projects

Hierarchical Document Workspace App (Demo | Code | Live Site)

- Built and deployed a full-stack hierarchical document workspace app via **Next.js**, React, TypeScript & Tailwind with authentication, full-text search, block-based rich-text editing & nested page structure
- Designed a layered architecture separating Server Actions, service-layer business logic, Prisma ORM, and React server/client components for maintainability via separation of concerns
- Implemented session-based **authentication** (BetterAuth) and ownership-based authorization across page operations to enforce secure, private data access
- Developed **full-text search** via GIN indexing, pagination, debounced search, highlighted matches, relevance ranking & stored vectors to avoid recomputation for SQL query performance
- Integrated BlockNote with custom blocks and menus, JSON document persistence, breadcrumb page navigation, debounced autosave to reduce unnecessary database writes
- Designed DB schema & integrated **PostgreSQL** via Prisma for streamlined data access, deploying the production application on Vercel

Bank Mobile App (Demo | Code)

- Built and deployed a RESTful Java full-stack banking system via **Spring Boot** & PostgreSQL, using a layered architecture (controller, service, repository) for maintainability
- Designed DB schema & integrated PostgreSQL via Hibernate ORM for streamlined data access
- Built client UI in Android Studio & integrated 5 REST endpoints by analyzing user interface flow, enabling core banking operations (account creation, deposit, withdraw, transfer, statement generation)
- Applied TDD, JUnit, Mockito, and MockMVC, covering **15 automated** unit, controller and service integration-level tests for code reliability & efficient debugging through early defect detection
- Integrated business workflow validation in a core service layer before delegating operations, preventing invalid operations from propagating deeper into the system
- **Dockerized** Spring Boot API & deployed to AWS Lightsail, for mobile app access to REST API

Driving Simulation (Demo | Code)

- Built a **Python-based** driving simulation to model user progression on a virtual road
- Utilized PyGame API to develop application logic & UI elements (e.g. vehicles, live progress bar)
- Designed dynamic generation of AI traffic & rule-based movement logic with attention to detail, producing unpredictable collision scenarios that raise the game's challenge
- Developed 3 termination conditions to handle state transitions involving bounding box **collision detection** of user & AI, screen boundary violations, and finish-line completion logic

Experience

Orientation Logistics Volunteer — University of Toronto Aug 2019

- Assembled **8000+ student orientation kits** with student supplies in a fast-paced, deadline-driven environment through constant communication and teamwork with 100+ volunteers
- Collaborated with volunteers to manage 5000+ by-products from packing to maintain an organized workspace

Merchandiser Volunteer — Salvation Army Thrift Store Aug 2019

- Inspected and tagged **100+ books** for removal based on condition criteria, keeping customer-facing shelves stocked with sellable inventory
- Reshelved **100+ misplaced items** and realigned **200+ products** to keep the store organized and easy for customers to browse
